-! - ALTERNATIVE PRODUCTS: DROSOPHILA TROPOMYOSIN I GENE CAN PRODUCE
FOUR DIFFERENT ISOFORMS BY ALTENNATIVE PRODUCTS: A MUSCLE FORM,
A NON-MUSCLE FORM, AND TWO FUSION PROTEINS (33 AND 34).

-! - DOMAIN: THE MOLECULE IS IN A COILED COIL STRUCTURE. THE SEQUENCE
EXHIBITS: A PROMINENT SEVENT-RESIDUES PERIODICITY.

-! - SIMILARITY: BELONGS TO THE TROPOMYOSIN FAMILY.

-! - SIMILARITY: BELONGS TO THE TROPOMYOSIN FAMILY.

-! - CAUTION: REF. 2 SEQUENCE DIFFERS FROM THAT SHOWN MAINLY BECAUSE
OF ALTERNATIVE EXON USAGE.

The present sequence represents a M.tuberculosis antigen, Tb37-FL The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or prevention).

```
A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, Tb37-FL. The immunogenic polypeptide can be used to diagnose M.tuberculosis infection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-emb1/AA1998.DAT:AAW81705

This polypeptide comprises Mycobacterium tuberculosis antigen Tb37-FL. It is encoded by genomic DNA isolated from a M. tuberculosis strain H37Rv genomic library using a probe from clone Tb38-1 (see AAVA484). The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAMA64291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of a soluble tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated Mycobacterium tuberculosis polypeptides and DNA - used to develop products for the detection of M. tuberculosis infection and diagnosis of tuberculosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunishin against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - use to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          226 LeuGlnGlnValThrSertjeuPheSerGlnValGlyGlyThrGlyGlyGl 242

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's.

M. tuberculosis Ag's, DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M. tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAA19249 to AAZ19460 and AAA39983 to

The present sequence is that of the Mycobacterium tuberculosis MTBN3 protein. This is 1 of 8 proteins, i.e. MTBN1-8 (see AAB19842-49), encoded by 8 open reading frames (see AAAB9035-42) identified as being present in the genome of M. tuberculosis but absent from the genome of the BGG strain of Mycobacterium bovis.

MTBN1-8 represent reagents that are useful in discriminating between the tuberculosis and BGG and, in particular, for diagnostic methods which discriminate between exposure of a subject to M. tuberculosis and vaccination with BGG. The invention features these MTBN polypeptides, functional fragments of them, DNA encoding them, vectors, transformed cells, and diagnostic, therapeutic, and prophylactic (vaccine) methods, including genetic vaccination methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polypeptide encoded by open reading frames present in Mycobacterium tuberculosis genome and not by the BCG strain of M. bovis, useful as vaccine and for diagnosing tuberculosis infection

                                                                                                                                                                                                                                                                                                                                                                                                  401
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4,

The present sequence represents a Mycobacterium tuberculosis protein. Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis,
                                                                                                                                                                                New isolated mycobacteria polypeptides and nucleic acids - used developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis
                                                                                           R, Oettinger T, Rasmussen

```
The invention describes a substantially pure immunogenic polypeptide fragment (I) from Mycobacterium tuberculosis that is able to evoke a protective immune response against infections by mycobacteria belonging to the tuberculosis complex. The invention provides a (1) fusion polypeptide comprising at least one polypeptide fragment (I) and at least one fusion partner; (2) a fusion polypeptide fragment comprising a T-cell epitope from M. tuberculosis, and/or including a repitope from M. tuberculosis, and/or including a sequence which protects the first amino acid sequence from m. tuberculosis, and/or including a sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment that encodes the above polypeptides. The polypeptides and nucleic acid are useful as pharmaceuticals, for diagnosis of and as antigens for are useful as pharmaceuticals, for diagnosis of and as antigens for ovacination against TB caused by Mycobacterium tuberculosis, africanum or bravious sensitization in an animal with bacteria belonging or previous sensitization in an animal with bacteria belonging to the cresponse in a mammal; use of CFP3M, CFP19 or MPT59-ESAT6, cFP3M, CFP19,                                                                                                                                                                                                                                                                                                                      Immunogenic; Mycobacter'um tuberculosis; immune response; infection; tuberculosis; fusion polypeptide; T-cell epitope; ESAT-6; MPT59; TB; pharmaceutical; vaccination; M. africanum; M. bovis; CFP7A; CFP3A; CFP7B; CFP1B; CFP19; CFP27; CFP3A; RD1-ORF; CFP10A; CFP16; CFP19; CFP23;

Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis,
                                                                                                                                                                                                                                                        The present sequence represents a Mycobacterium tuberculosis protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Immunogenic; Mycobacterium tuberculosis; immune response; infection; tuberculosis; fusion polypeptide; T-cell epitope; ESAT-6; MPT59; TB; pharmaceutical; vaccination; M. africanum; M. bovis; CFP7A; CFP90A; CFP7B;                                                                                               New isolated mycobacteria polypeptides and nucleic acids - used for developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis

The invention describes a substantially pure immunogenic polypeptide fragment (1) from Mycobacterium tuberculosis that is able to evoke a protective immune response against infections by mycobacteriab belonging to the tuberculosis complex. The invention provides a (1) fusion to the tuberculosis complex. The invention provides a (1) fusion polypeptide fragment (1) and at least one fusion partner; (2) a fusion polypeptide fragment comprising a recell ceptope from M. tuberculosis protein ESATé, or MPTF9 and a second different amino acid sequence from M. tuberculosis, and/or including a sequence which protects the first amino acid sequence from in vivo degradation or post-translational processing; (3) a nucleic acid fragment that encodes the above polypeptides. The polypeptides and nucleic acid are useful as pharmaceuticals, for diagnosis of and as antigens for vaccination against TB caused by Mycobacterium tuberculosis, africanum or previous sensitization in an animal with bacteria belonging to the tuberculosis complex. The invention also describes the use of CrP7A or creptone of for diagnosis of TB in a mammal by performing a DTH type skin test; use of GrP27, CPP19, CP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     153 GCCCGCCCCCCCCCTGGCCCTGATCCACCAGCCGGCTGGTTCGACA 104
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     17 gProAlaProAlaLeuGlyProAspProProAlaSerGlyTrpPheAspS 34

AAD05389-AAD05473 reprefent cDNAs corresponding to 29 human secreted protein genes, and AAE01546-AAE01630 represent the proteins they encode. AAE01631-AAE01660 represent human secreted proteins by ragments or variants. The secreted proteins and their genes are useful for preventing. The secreted proteins and their genes are useful for preventing, therapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the contains in the new genes. Specific uses are described for each of the mutations in the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders, schizophrenia, asthma,
                                                                                                                                                                                                                                     foetal abnormality; developmental abnormality; haematopoietic disorder; immune system disorder; AIDS; autoimmune disease; rheumatoid arthritis; inflammation; allergy, neurological disorder; Alzheimer's disease; Parkinson's disease; cognitive disorder; schizophrenia; asthma; skin disorder; psoriasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; angiogenic disorder; kidney disorder; endocrine disorder; infection; wound healing; vulnerary; cell culture; chemotaxis; food additive; chomosome 17; binding partner identification; gene therapy.

skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, kidney disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell profesoration, to prevent skin aging due to submurn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as food additive or preservative to modify storage properties.

Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunossasys or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              seq_name: /SIDS1/gcgdata/hold-geneseq/geneseqp-emb1/AA2000.DAT:AAB54248

The human pancreatic cancer antigens have cytostatic, cancer therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. Catch hybridisation probes that can be used in chromosome mapping, linkage pancreatic cancer antigen polynuclectides can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage and linguistic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to generate antibodies can be used to treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or perpendence used to treat or prevent neural, immune system, muscular, conners used in the average the polypetides and disorders.                                                                                                                                                                                                                                                                                                                                                                                                                                          encoded polypeptides (AAM'8323'AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymeptides are useful in gene therapy, vaccines or polymetide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopolesis requiating activity, tissue growth factor activity, immunomodulatory activity and activity, and may be useful in the diagnosis and/or

```
The present sequence represents a human Wiskott-Aldrich syndrome protein (WASP)-interacting protein (WIP). WIP or DNA encoding WIP can be administered to an individual, in sufficient quantity to alter actin content and/or the extent to which polymerisation occurs, and thus, to prevent or reduce (totally or partially) cytoskeletal abnormalities and other adverse effects. In particular, Wiskott-Aldrich syndrome can be treated or prevented in this manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; Wiskott-Aldrich syndrome; Wiskott-Aldrich syndrome protein; WASP; WASP; WASP-interacting protein; WIP; actin.
